POP Access Settings

[Close Window]

In order to read your Yahoo! Mail in an external email client (such as Eudora, Outlook, Netscape, etc.), you will need to configure the Incoming (POP) and Outgoing (SMTP) server settings so that it can send and receive messages from your Yahoo! Mail account. Generally, you can find these settings under the Tools or Preferences menus for your particular email program.

Important: Do not delete your incoming mail settings

If you are already receiving mail from another mail server (such as incoming mail to your address at your ISP), you will need to add a new POP account. Sometimes this is called a new "profile," sometimes a new "personality," depending on your email client. If your email client only allows you to receive mail from one POP server at a time, make sure you write down your current settings before you replace them with Yahoo! Mail settings so that you can change them back if you need to. Below you will find the server settings for accessing your Yahoo! Mail.

Server Settings	
Incoming Mail Server (POP3):	**in.pop.mail.yahoo.com** Use SSL, port: 995
Outgoing Mail Server (SMTP):	**in.smtp.mail.yahoo.com** Use SSL, port: 465, use authentication
Account Name/Username:	**jayantadn@yahoo.co.in**

Server Settings	
Email address:	**jayantadn@yahoo.co.in**
Password:	**Your Yahoo! Mail password**

We've given directions below for configuring POP access to Yahoo! Mail for selected email clients. Your client may not be on this list, and server settings vary from client to client. Remember, even after you configure your mail client to send and receive Yahoo! Mail messages, you can always log in to your Yahoo! Mail account to send and receive as well.

For more detailed information on how to set up a particular mail client, please visit:

- Setting up Netscape Mail
- Setting up Microsoft Outlook
- Setting up Microsoft Outlook Express
- Setting up Eudora Pro
- Setting up another email client
